What Your Peers Have to Say:

“MEA and LAL testing is a minimum for us. We prefer to take products that are tested. In the absence of those two manufacturer provided tests, then we feel obligated to do it in our own hands, which takes extra person hours that is a scarce commodity. If we can find a product that has those two provided testing capabilities already built in to the product, we go for it.”

“MEA testing is something that us as embryologists want to see.”

“Anything that is coming into contact with an egg or a sperm, in our opinion, should be MEA tested, of which the catheter and the needle guides are 100% part of that process and that pathway, so they will need to be tested.”

“Most people pay out of pocket, so you're dealing with someone's... essentially their life. And I think that also plays a big role when you're thinking about the equipment you want. You want to make sure that you can get the outcome that these people desire. So I think that plays a big role in it as well.”
